the electric motor also drives and thereby controls rotation of gears affixed to shafts of the
two cutting tool sets, such that the gears affixed to the shafts of the cutting tool sets drive
and thereby rotate the two cutting tool sets, and

two sets of circular paper shredder cutting blades are peripherally mounted with cutting edges, the two sets of circular paper shredder cutting blades being engaged in a mutual interlacing fashion, the cutting blades being sufficiently robust to shred paper and to shatter compact discs; and wherein

a connecting gear is connected to the gears of the decelerator, and the connecting gear drives and thereby rotates two cutting tool gears which separately drive and thereby rotate the set of rotary cutters, such that

when a compact disc is inserted between the two rotary cutters through the compact disc insertion opening defined in the top surface of the top cover, the compact disc is efficiently broken into small pieces.
